UPDATE ON THE LÉVY-HBT ANALYSIS

Dániel Kincses 8th June 2023

STAR Correlations and Fluctuations PWG Meeting

Lévy HBT analysis at STAR, Au+Au @ 200 GeV

- Run-16: Issues with HFT, primary/global differences, decided to switch to Run-11
- **Run-11 analysis:** • STAR Run-11 Au+Au@√s_{NN}=200 GeV, 556 M evts. 5[°]10⁸ Z[°]10⁷ vpd-zdc-mb-protected, 20-40% 10⁶ 40-80% 350003, 350013, 350023, 350033, 350043 10^{5}
 - After trigger cuts and bad run cuts: **550M events**

Event cuts:

EÖTVÖS LORÁND NIVERSITY | BUDAPEST

•
$$\left| v_z^{TPC} - v_z^{vpd} \right| < 3 \text{ cm}; \left| v_z^{TPC} \right| < 25 \text{ cm}; \left| v_z^{vpd} \right| < 25 \text{ cm}; v_r^{TPC} < 2 \text{ cm}$$

10

 10^{3}

 10^{2}

10

100

200

- Pile-up cut: 3 REFmult-75 < TOFmult < 5 REFmult+75
- After event cuts and 20-40% centrality selection: 110M events

600 RefMultCorr

5-10%

400

0-5%

500

10-20%

300

Analysis cuts

• Track cuts:

- Using only primary tracks
- 0.15 GeV/c < p_T < 1.5 GeV/c
- |*η*| < 0.75
- NhitsFit > 20
- NHitsFit/NHitsPoss > 0.55
- DCA < 1.5 cm
- TOF N σ PID based on $dt_{\pi,K,p} = t\left(1 \beta \sqrt{1 + m_{\pi,K,p}^2/p^2}\right)$
- If btofMatchFlag = 1, combined PID: $\sqrt{N\sigma_{TOF,\pi}^2 + N\sigma_{TPC,\pi}^2} < 2.5$
- Good separation even at highest mom., no veto cut needed
- If no TOF info, use TPC PID: $N\sigma_{TPC,\pi} < 2$, $N\sigma_{TPC,K,p,e} > 2$
- Pair cuts: SL < 0.6, FMH = 0

MaxDuInner = 1.8 cm, MaxDuOuter = 2.4 cm, MaxDzInner = 5.5 cm, MaxDzOuter = 5.7 cm, Dr > 4 cm

3/8

STAR 20-40% Au+Au @ 200GeV, 1.35 < p < 1.40 GeV/c

Fitting of the correlation functions

- 1D two-pion corr. functions
- 21 kT bins,
 0.175 GeV/c to 0.750 GeV/c
- Iterative fitting method, incorporates Coulomb FSI and Lévy-source assumption
- Fits converged and have conf.level > 0.001 in all kT bins

DÁNIEL KINCSES

EÖTVÖS LORÁND university | budapest

Systematic uncertainty investigations

- Systematic uncertainties already investigated:
 - Pair cut variations
 - PID with TOF-dEdx combined, TOF only, dEdx only
 - PID Nsigma variations
 - Rapidity cut variations
 - Nhits cut variations
 - DCA cut variations
- Systematic uncertainties to be investigated:
 - Fit limit variations
 - Effect of strong interaction
 - Separating charges (pi+pi+, pi-pi- separately)

m_T dependence of the extracted source parameters

- Correlation strength lambda: low-mT decrease, high-mT saturation
- Lévy-scale R: usual decreasing trend with mT

EÖTVÖS LORÁND university | budapest

Lévy exponent alpha: very small dependence on mT, as expected

Homework – compare corr.func. to published

- *Phys.Rev.C* 92 (2015) 1, 014904 no corr.func. in the paper, however, there is an example in the appendix of Chris Anson's <u>thesis</u>
- Not every setting and cut was detailed in the text, but still good agreement

06/08/2023

Figure A.3: The effect of varying the splitting level is very small in this example from 200 GeV data taken in 2010. The fraction of merged hits requirement was FMH < 0.1 and the number of hits requirement for tracks was $N_{\rm hits} > 15$. With FMH < 0.01 and FMH < 1, there is also negligible variation with splitting level.

DÁNIEL KINCSES

Summary

- One-dimensional two-pion correlation functions investigated
- Fits with Lévy-source assumption + Coulomb FSI provide good description
- Systematic uncertainty investigations underway
- Next steps:

ÖTVÖS LORÁND

- Writing a detailed analysis note (in progress)
- More systematic uncertainty sources investigated (in progress)
- More centrality ranges investigated (in progress)
- Repeating the same analysis for kaons
- Reporting more details soon!

Further details, backup slides

Properties of univariate stable distributions

- Univariate stable distribution: $f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi(q) e^{-ixq} dq$, where the characteristic function:
- $\varphi(q; \alpha, \beta, R, \mu) = \exp(iq\mu |qR|^{\alpha}(1 i\beta \operatorname{sgn}(q)\Phi))$
- α : index of stability
- β : skewness, symmetric if $\beta = 0$
- *R*: scale parameter

EÖTVÖS LORÁND

• μ : location, equals the median, if $\alpha > 1$: μ = mean

- Important characteristics of stable distributions:
 - Retains same α and β under convolution of random variables
 - Any moment greater than α isn't defined

10

 $R_{\sigma\nu}^2 = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & R_{\text{out}}^2 & 0 & 0 \\ 0 & 0 & R_{\text{side}}^2 & 0 \\ 0 & 0 & 0 & R_{\text{side}}^2 \end{pmatrix}$

Lévy-type sources in heavy-ion collisions

Anomalous diffusion

EÖTVÖS LORÁND

NIVERSITY | BUDAPEST

- Elastic rescattering of hadrons
- Expanding hadron gas \rightarrow time dependent increasing mean free path

Csanád, Csörgő, Nagy,

Braz.J.Phys. 37 (2007) 1002;

T. J. Humanic, Int. J. Mod. Phys. E 15, 197 (2006)

- Hadronic Resonance Cascade (HRC) model
- α depends on total inelastic cross-section
- $\alpha_{\pi}^{HRC} > \alpha_{K}^{HRC}$ (smaller c.s. \rightarrow larger m.f.p.)

DÁNIEL KINCSES

• Kaon vs. pion measurements can test the anom.diff. Picture

06/08/2023

• Motivation for Lévy femtoscopy with kaons!

Second order phase transition?

- Second order phase transitions: critical exponents
 - Near the critical point
 - Specific heat ~ $((T T_c)/T_c)^{-\alpha}$
 - Order parameter ~ $((T T_c)/T_c)^{-\beta}$
 - Susceptibility/compressibility ~ $((T T_c)/T_c)^{-\gamma}$
 - Correlation length ~ $((T T_c)/T_c)^{-\nu}$
 - At the critical point
 - Order parameter ~ (source field)^{$1/\delta$}
 - Spatial correlation function ~ $r^{-d+2-\eta}$
 - Ginzburg-Landau: $\alpha = 0, \beta = 0.5, \gamma = 1, \eta = 0.5, \delta = 3, \eta = 0$
- QCD \leftrightarrow 3D Ising model

ÖTVÖS LORÁND

- Can we measure the η power-law exponent?
- Depends on spatial distribution: measurable with femtoscopy!
- What distribution has a power-law exponent? Levy-stable distribution!

Lévy index as critical exponent?

• Critical spatial correlation: $\sim r^{-(d-2+\eta)}$; Lévy source: $\sim r^{-(1+\alpha)}$; $\alpha \Leftrightarrow \eta$?

Csörgő, Hegyi, Zajc, Eur.Phys.J. C36 (2004) 67

- QCD universality class ↔ 3D Ising Halasz et al., Phys.Rev.D58 (1998) 096007 Stephanov et al., Phys.Rev.Lett.81 (1998) 4816
- At the critical point:
 - Random field 3D Ising: $\eta = 0.50 \pm 0.05$ *Rieger, Phys.Rev.B52 (1995) 6659*
 - 3D Ising: η = 0.03631(3)

El-Showk et al., J.Stat.Phys.157 (4-5): 869

- Motivation for precise Lévy HBT!
- Change in α_{Levy} proximity of CEP?

- Modulo finite size/time and non-equilibrium effects
- Other possible reasons for Lévy distributions: anomalous diffusion, QCD jets, ...

Kinematic variables of the correlation function I.

- Smoothness approximation $(p_1 \approx p_2 \approx K)$: $S(x_1, K q/2) S(x_2, K + q/2) \approx S(x_1, K) S(x_2, K)$
- $C_2(q,K) = \int d^4 r D(r,K) \left| \psi_q^{(2)}(r) \right|^2$ Without any FSI $\left| \psi_q^{(2)}(r) \right|^2 = 1 + \cos(qr)$ $\begin{cases} C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(0,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(q,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(q,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(q,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K) e^{iqx} d^4x \\ C_2^{(0)}(q,K) \simeq 1 + \frac{\widetilde{D}(q,K)}{\widetilde{D}(q,K)}, \text{ where } \widetilde{D}(q,K) = \int D(x,K)$
- HBT correlation function in direct connection with Fourier transform of the pair-source function
- Important to determine the nature and dimensionality of the correlation function
- Lorentz-product of $q = (q_0, q)$ and $K = (K_0, K)$ is zero, i.e.: $qK = q_0K_0 qK = 0$
- Energy component of q can be expressed as $q_0 = q \frac{\kappa}{\kappa_0}$
- If the energy of the particles are similar, K is approximately on shell
- Correlation function can be measured as a function of three-momentum variables

Kinematic variables of the correlation function II.

- $C_2(q, K)$ as a function of three-momentum variables
- *K* dependence is smoother, *q* is the main kinematic variable
- Close to mid-rapidity one can use $k_T = \sqrt{K_x^2 + K_y^2}$, or $m_T = \sqrt{k_T^2 + m^2}$
- For any fixed value of m_T , the correlation function can be measured as a function of q only
- Usual decomposition: out-side-long or Bertsch-Pratt (BP) coordinate-system
 - $\boldsymbol{q} \equiv (q_{out}, q_{side}, q_{long})$
 - long: beam direction
 - out: k_T direction
 - side: orthogonal to the others
 - Essentially a rotation in the transverse plane
- Customary to use a Lorentz-boost in the long directon and change to the Longitudnal Co-Moving System (LCMS) where the average longitudinal momentum of the pair is zero

EÖTVÖS LORÁND university | budapest

Kinematic variables of the correlation function III.

- Drawback of a 3D measurement: lack of statistics, difficulties of a precise shape analysis
- What is the appropriate one-dimensional variable?
- Lorentz-invariant relative momentum: $q_{inv} \equiv \sqrt{-q^{\mu}q_{\mu}} = \sqrt{q_x^2 + q_y^2 + q_z^2 (E_1 E_2)^2}$
- Equivalent to three-mom. diff. in Pair Co-Moving System (PCMS), where $E_1 = E_2$: $q_{inv} = |q_{PCMS}|$
- In LCMS using BP variables: $q_{inv} = \sqrt{(1-\beta_T)^2 q_{out}^2 + q_{side}^2 + q_{long}^2}$ $\beta_T = 2k_T/(E_1 + E_2)$
- Value of q_{inv} can be relatively small even when q_{out} is large!
- Experimental indications: in LCMS source is \approx spherically symmetric
- Correlation function boosted to PCMS will not be spherically symmetric
- Let us introduce the following variable invariant to Lorentz boosts in the beam direction:

$$Q \equiv |\mathbf{q}_{LCMS}| = \sqrt{(p_{1x} - p_{2x})^2 + (p_{1y} - p_{2y})^2 + q_{z,LCMS}^2},$$

where $q_{z,LCMS}^2 = \frac{4(p_{1z}E_2 - p_{2z}E_1)^2}{(E_1 + E_2)^2 - (p_{1z} + p_{2z})^2}.$

Kinematic variables of the correlation function IV.

• Nature of the 1D variable in experiment: check correlation function in two dimensions!

Figure 3.4: Example two-dimensional pion correlation functions for $\sqrt{s_{NN}} = 200 \text{ GeV Au}+\text{Au}$ collisions (a) and $\sqrt{s} = 91 \text{ GeV } e^+e^-$ collisions (b). The latter figure is taken from the thesis of Tamás Novák [161].

```
Q dep. corr.func. q_{inv} dep. corr.func.
```

Figure 3.5: Toy model calculation for two different types of source functions. Taking a Gaussian source in both space and time leads to a correlation function that depends mostly on $|q_{LCMS}|$ (a), while a source that shows strong space-time and momentum space correlation leads to a q_{inv} dependent correlation function (b).

DÁNIEL KINCSES

Kinematic variables of the correlation function V.

• Nature of the 1D variable in experiment: check correlation function in two dimensions!

06/08/2023

$$Q = |\mathbf{q}_{LCMS}| = \sqrt{(p_{1x} - p_{2x})^2 + (p_{1y} - p_{2y})^2 + q_{long,LCMS}^2}$$

DÁNIEL KINCSES

EÖTVÖS LORÁND UNIVERSITY | BUDAPEST 18

Kinematic variables of the correlation function VI.

- Correlation function measured in LCMS, Coulomb effect calculated in PCMS
- Approximation:

EÖTVÖS LORÁND NIVERSITY | BUDAPEST

(Note $m_T < m$ ٠ not physical of course)

DÁNIEL KINCSES

Coulomb correction and fitting of the corr. function

- Core-Halo model, Bowler-Sinyukov method: $C_2(Q, k_T) = 1 \lambda + \lambda \int d^3 r D_{(c,c)}(r, k_T) |\Psi_Q^{(2)}(r)|^2$
- Neglecting FSI and using a Lévy-stable source function: $C_2^{(0)}(Q, k_T) = 1 + \lambda e^{-|RQ|^{\alpha}}$
- Using numerical integral calculation as fit function results in numerically fluctuating χ^2 landscape
- Treat FSI as correction factor: $K(Q, k_T) = \frac{C_2(Q, k_T)}{C_2^{(0)}(Q, k_T)}$

ÖTVÖS LORÁND Iniversity | budapest

- An iterative method can be used: $C_2^{(fit)}(Q;\lambda,R,\alpha) = C_2^{(0)}(Q;\lambda,R,\alpha) \cdot K(Q;\lambda_0,R_0,\alpha_0)$
- Procedure continued until $\Delta_{\text{iteration}} = \sqrt{\frac{(\lambda_{n+1} \lambda_n)^2}{\lambda_n^2}} + \frac{(R_{n+1} R_n)^2}{R_n^2} + \frac{(\alpha_{n+1} \alpha_n)^2}{\alpha_n^2} < 0.01$
- Iterations usually converge within 2-3 rounds, fit parameters can be reliably extracted

Coulomb correction and fitting of the corr. function

- Lévy-type correlation function without final state effects: $C^{(0)}(Q) = 1 + \lambda \cdot e^{-|RQ|^{\alpha}}$
- Sinyukov method: $C(Q_{\text{LCMS}}; \lambda, R_{\text{LCMS}}, \alpha) = \left(1 - \lambda + \lambda \cdot K(q_{inv}; \alpha, R_{\text{PCMS}}) \cdot (1 + e^{-|R_{\text{LCMS}}Q_{\text{LCMS}}|^{\alpha}})\right) \cdot N \cdot (1 + \varepsilon Q_{\text{LCMS}})$ $C(Q_{\text{LCMS}}; \lambda, R_{\text{LCMS}}, \alpha) = \left(1 - \lambda + \lambda \cdot K(q_{inv}; \alpha, R_{\text{PCMS}}) \cdot (1 + e^{-|R_{\text{LCMS}}Q_{\text{LCMS}}|^{\alpha}})\right) \cdot N \cdot (1 + \varepsilon Q_{\text{LCMS}})$ Coulomb correction
- Coulomb-correction calculated numerically (in PCMS)

$$q_{\rm inv} \equiv q_{\rm PCMS} \approx q_{\rm LCMS} \cdot \sqrt{1 - \beta_T^2/3} \qquad \qquad R_{\rm PCMS} \approx R_{\rm LCMS} \cdot \sqrt{\frac{1 - 2\beta_T^2/3}{1 - \beta_T^2}}$$

EÖTVÖS LORÁND university | budapest 06/08/2023

Possible linear

Shape of the correlation function

$$C_2(Q) = 1 - \lambda + \lambda \cdot K(Q; \alpha, R) \cdot \left(1 + e^{-|RQ|^{\alpha}}\right)$$
