

sTGC Alignment

Gavin Wilks

University of Illinois at Chicago

04/28/23

$\Delta v = 200\mu\text{m}$

$\sim 0.5\text{M tracks}$

| Parameter | Input | Output | Error | Global Corr. |
|-------------------------------|-------|--------|-------|--------------|
| $\Delta u (\mu\text{m})$ | 0.0 | -11.5 | 21.3 | 0.672 |
| $\Delta v (\mu\text{m})$ | 200 | 160.5 | 23.1 | 0.715 |
| $\Delta \gamma (\text{mrad})$ | 0.0 | -0.072 | 0.110 | 0.816 |

$\Delta v = 200\mu\text{m}$

$\sim 5\text{M tracks}$

| Parameter | Input | Output | Error | Global Corr. |
|-------------------------------|-------|--------|-------|--------------|
| $\Delta u (\mu\text{m})$ | 0.0 | -11.4 | 6.49 | 0.672 |
| $\Delta v (\mu\text{m})$ | 200 | 163.8 | 7.03 | 0.714 |
| $\Delta \gamma (\text{mrad})$ | 0.0 | -0.054 | 0.034 | 0.816 |

Δv has a significant negative shift after increasing statistics.

BACKUP

Alignment (global) Parameters

FTT (sTGC)

- 6 alignment parameters per pentagon (16 pentagons).
- 6 per plane (4 planes).
- 6 for sTGC.
- 126 alignment parameters.

Single Pentagon Alignment

- Misalign 1 Pentagon (4) in sTGC simulated geometry. Located in +x,+y quadrant on plane second closest to IP.
- Throw mu+ with particle gun with following settings:
 - $0.2 < p_T < 2.0$ GeV/c
 - $2.3 < \eta < 4.4$
 - $0.0 < \phi < 1.83$ rad
 - $B = 0$ T
- Require hits on all sTGC and FST planes and pentagon module 4 (~450k tracks in our sample).
- Fit with GenFit Kalman filter and then refit with GenFit GBL.
- Output data to Mille.dat files. Mille.dat files are then fed to pede.
- Fix rotations about u-axis and v-axis, in addition to w translation all to 0.
- Matrix inversion used to solve for alignment parameters.

Testing Alignment

$\Delta\gamma = 2 \text{ mrad}$

| Parameter | Input | Output | Error | Global Corr. |
|----------------------------------|-------|--------|-------|--------------|
| $\Delta u \text{ (}\mu\text{m)}$ | 0.0 | -21.4 | 21.2 | 0.671 |
| $\Delta v \text{ (}\mu\text{m)}$ | 0.0 | -22.9 | 23.0 | 0.714 |
| $\Delta\gamma \text{ (mrad)}$ | 2.0 | 1.941 | 0.110 | 0.815 |

$\Delta u = 200\mu\text{m}$

| Parameter | Input | Output | Error | Global Corr. |
|----------------------------------|-------|--------|-------|--------------|
| $\Delta u \text{ (}\mu\text{m)}$ | 200 | 185.1 | 21.3 | 0.673 |
| $\Delta v \text{ (}\mu\text{m)}$ | 0.0 | -31.9 | 23.0 | 0.714 |
| $\Delta\gamma \text{ (mrad)}$ | 0.0 | -0.042 | 0.110 | 0.817 |

- Consistent within 2σ .
 - I would like to increase the statistics again to see if this holds.
- For the rotation of $\Delta\gamma$ we rotate entire 2nd sTGC plane to prevent geometry overlaps for the time being.

$\Delta v = 200\mu\text{m}$

| Parameter | Input | Output | Error | Global Corr. |
|----------------------------------|-------|--------|-------|--------------|
| $\Delta u \text{ (}\mu\text{m)}$ | 0.0 | -11.5 | 21.3 | 0.672 |
| $\Delta v \text{ (}\mu\text{m)}$ | 200 | 160.5 | 23.1 | 0.715 |
| $\Delta\gamma \text{ (mrad)}$ | 0.0 | -0.072 | 0.110 | 0.816 |

Testing Alignment Software

No Misalignment

| Parameter | Input | Output | Error | Global Corr. |
|------------------------------|-------|--------|--------|--------------|
| Δu (μm) | 0.0 | -22.0 | 36.8 | 0.672 |
| Δv (μm) | 0.0 | -37.2 | 39.8 | 0.714 |
| $\Delta\gamma$ (mrad) | 0.0 | 0.0075 | 0.1899 | 0.816 |

$\Delta u = 50\mu\text{m}$

| Parameter | Input | Output | Error | Global Corr. |
|------------------------------|-------|---------|-------|--------------|
| Δu (μm) | 50 | 34.6 | 37.0 | 0.671 |
| Δv (μm) | 0.0 | -28.2 | 40.1 | 0.713 |
| $\Delta\gamma$ (mrad) | 0.0 | -0.0161 | 0.192 | 0.816 |

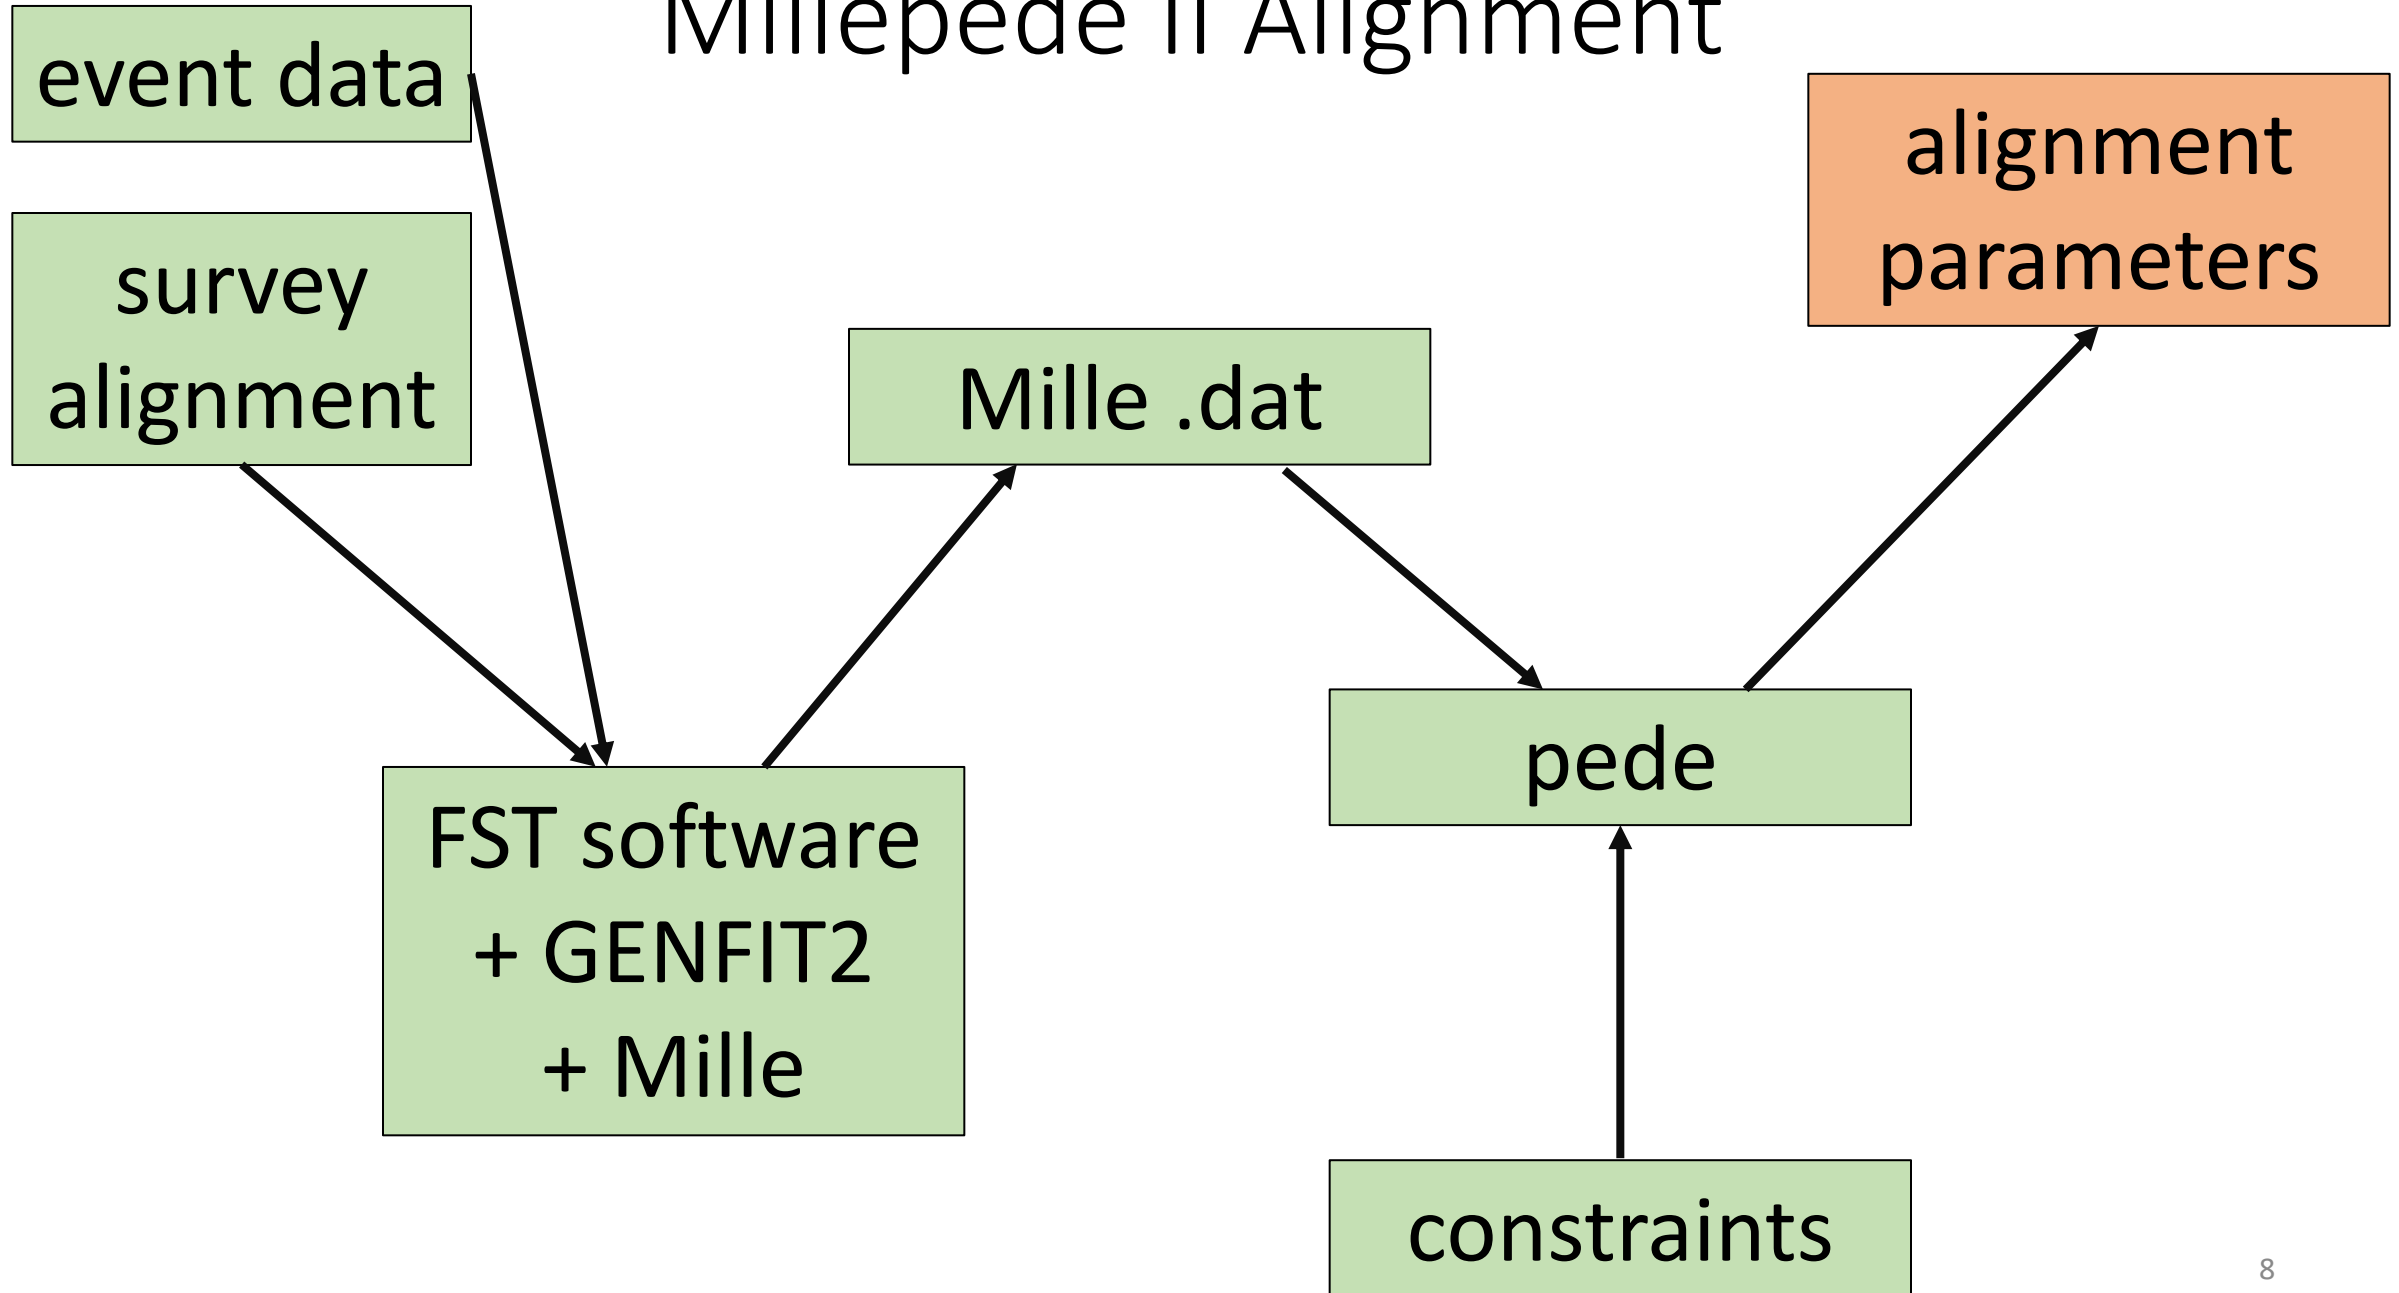

Differences from FST

- We are testing a whole pentagon not just one inner or outer sensor with a similar number of tracks.
- Error is an order of magnitude higher for each parameter.
- Global correlation for Δu is larger.
- Global correlations for Δv and $\Delta\gamma$ are smaller, which we would expect.

$\Delta v = 50\mu\text{m}$

| Parameter | Input | Output | Error | Global Corr. |
|------------------------------|------------------|---------|-------|--------------|
| Δu (μm) | 0.0 | -13.6 | 36.7 | 0.672 |
| Δv (μm) | 50 μm | 37.2 | 39.8 | 0.714 |
| $\Delta\gamma$ (mrad) | 0.0 | -0.0353 | 0.191 | 0.816 |

Millepede II Alignment

Millepede-II with GBL

- Track parameterized by $\mathbf{q} = (\mathbf{u}_i, \dots, \mathbf{u}_{\#planes})$, where \mathbf{u}_i vectors are offsets at FST or sTGC plane.
- Minimize the following function, where \mathbf{p} are the alignment parameters and \mathbf{q}_j are the track parameters.

$$\chi^2(\mathbf{p}, \mathbf{q}) = \sum_j^{\text{tracks}} \sum_i^{\text{measurements}} \left(\frac{m_{ij} - f_{ij}(\mathbf{p}, \mathbf{q}_j)}{\sigma_{ij}} \right)^2$$

- Data necessary to run Millepede-II:

| | |
|---|---|
| # of local parameters | array: $\left(\frac{\partial f}{\partial q_j} \right)$ |
| # of global parameters | array: $\left(\frac{\partial f}{\partial p_l} \right)$ |
| residuals = $m_{ij} - f_{ij}(\mathbf{p}, \mathbf{q}_j)$ | label array, l |
| σ = standard deviation of the measurement | |

https://www.desy.de/~kleinwrt/MP2/doc/html/draftman_page.html

Hierarchy of Alignment Parameters

- Each track prediction for a sensor relies on the larger structures it is contained within.
 - Sensor on wedge, wedge on FST half, half on Full FST, full on TPC.
- We can calculate the all the global derivatives using chain rule

$$\frac{df_{u/v}}{d\Delta\mathbf{p}_l} = \frac{d\Delta\mathbf{p}_s}{d\Delta\mathbf{p}_l} \cdot \frac{df_{u/v}}{d\Delta\mathbf{p}_s},$$

$f_{u/v}$ = track prediction
 $d\Delta\mathbf{p}_s$ = change in sensor global parameter
 $d\Delta\mathbf{p}_l$ = change in containing structure global parameter

- The sum of all sensors global parameters pertaining to a larger substructure are constrained to zero to prevent shift of overall structure by the sub-components.
- Constraints added by .txt file input to pede.

Multiple Scattering in GBL

- Multiple scattering covariance from the previous measurement plane accounted for at the current measurement plane in the GBL trajectory.

- The covariance matrix of scattering angle (w.r.t track direction) is calculated using:

$$\sigma_{\theta} = \frac{0.0136}{p} \sqrt{x/\chi_0} [1 + 0.038 \ln(x/\chi_0)].$$

$$V_k = \begin{pmatrix} \sigma_{\theta}^2 & 0 \\ 0 & \sigma_{\theta}^2 \end{pmatrix}.$$

- Where x is track length within the sensor, χ_0 is the radiation length of the material and p is the magnitude of momentum.
- Kalman filter can treat material as continuous, while GBL uses discrete scatters.

GENFIT2 Classes for GBL

GblPoint.h/cc: contains all data for 2D measurements (derivatives, residuals, covariance, etc.).

GblTrajectory.h/cc: holds all GblPoints, can be fit or used directly for Mille output.

MilleBinary.h/cc: Organizes the data from GblTrajectory into the exact format required for pede.

GFGbl.h/cc: GBL fitter class implementing Mille binary file output and data collection. Originally written for BELLE II alignment.

StFwdGbl.h/cc: Adapted version of GFGbl for use with the Forward Tracker Alignment.

Single Sensor Alignment

- Mille.dat files are then fed to pede.
- Can specify initial values of alignment parameters and their pre-sigma (helps stabilize a poorly defined parameter).

```
Parameter
label    initial_value  presigma
...
label    initial_value  presigma
```

Example of pede
parameter entries.

- Fix rotations about u-axis and v-axis, in addition to w translation by setting pre-sigma < 0.0.
- Matrix inversion used to solve for alignment parameters.
- ~50k tracks used for each trial.
